Comment:  
Trophy hunting is cruel and unnecessary. In South Dakota, dozens of mountain lions are killed every year for trophies and bragging rights. In fact, more mountain lions are killed by trophy hunting than any other cause. Fewer than 300 mature-age mountain lions are thought to reside in South Dakota. South Dakota's rare mountain lion population must be protected from cruel trophy hunting.

As a former hunter I am very opposed to a pointless mountain lion season. If left alone the lions would help manage the excessive deer population. Humans need to feed their egos some other way, maybe helping fellow humans or photographing wildlife, instead of shooting mountain lions. Shooting animals for food serves a purpose; trophy hunting does not. Please don’t allow another pointless hunting season.

Comment:  
Why is the only answer to balancing the mountain lion life cycle with other animal nations typically solved with hunting and killing? Why can't a policy of removal and resettling for their lives and purpose be the first step? How can we claim as a nation to be humane when we support the killing thrill and joy for a trophy alone? If a mountain lion is hunted, then the hunter needs to pay much more for the animal's life and the body needs to be used for good, not a trophy. It is sickening that we promote killing as a sport of precious lives that God created. We didn't and yet we, as humans, just decide who lives and dies, what animal has intrinsic value at the auction as opposed to the beauty and value in the wild. We can live in balance if we trust wildlife science as we can if we trust fire suppression science. How much more do we need to kill to feel alive? Please stop allowing trophy hunting. It is cruel, pathetic and shows the emptiness of the 'hunter'. Thank you.

Comment:
Trophy hunting is inhumane. It's been 150 years since a human has been killed or maimed by a mountain lion. To take an animal's life to decorate with or for enjoyment is so sad. These are beautiful animals, who wish only to be left alone and far away from humans. Showing reverence for life is humane, good sportsmanship. To kill so that you may eat is one thing, but it's sick to kill for the fun of it. It doesn't say much for humans who have all the advantages to destroy these animals. They are part of the wild, they belong there, it's us who don't.

Comment:

Dear South Dakota Wildlife Management,

Please oppose the South Dakota Houndsmen Association’s petition to expand hound hunting of mountain lions in South Dakota and to protect mountain lions from trophy hunting. This is a cruel practice and not only cruel, but will actually increase conflicts with humans over time. South Dakota has a small population of cougars left. This practice will continue to push this top predator to extinction. Doing this destroys our children’s chance of enjoying the natural world and sends a message that short-term pleasure in blood sports is more important than anything else. In addition, this may bring short term profits to the state of South Dakota, in the long run, it will do the opposite. Killing off top line predators has proven to be detrimental to the environment which subsequently destroys the economy.

Sincerely,

Jen

Ate tag to a personal representative in case of an medical emergence. I have just contacted cancer and have a port to inject the treatment so I am not able to shoot a high power gun. I would like to transfer the right to my Son who has a good hunting record. By state law I am unable to do this. Law are written to help the farmer and the hunters. The place I hunt told me they were just going to start shooting deer and leave them lay. As a hunter I talked them let me do it for the meat. They agreed they have no faith in the Game Fish and Parks. The department will do anything to improve pheasant hunt especially for the out of state hunter but do not care about the instate hunter. The four Pheasant limit had them shut off all hunting on their land. Thats about how many pheasants they have on one sections but for the hunting lodges its okay. I have come to the farmer next to public hunting say they hardly ever hear a gun shot during pheasant season and do not see pheasant after the season. I guess I am speaking what I hear in the Public that the Game Fish and Parks governing only care about big money hunting not family hunting any more. the Group is made up of hunting and fishing guides not common people. Bill Janklow once said the When the common Man can not hunt hunting will be outlawed. I do not think the comission is closer than they know to this happening Please at least change one law so we can try to rid a rancher of deer and help a man get his son back in hunting again

RE: Proposed 2021-22 and 2022-23 Mountain Lion Hunting Seasons

Dear Chairman Olson, Director Kirschenmann and Members of the Commission,

On behalf of the Humane Society of the United States and our supporters in South Dakota, I thank you for this opportunity to submit comments on South Dakota Game, Fish and Parks’ (GFP) proposed 2021-22 and 2022-23 Mountain Lion Hunting Seasons (“Proposal”). We oppose the Proposal because it allows excessive levels of hunting on mountain lions (Puma concolor) harming their population in South Dakota.

The Humane Society of the United States is opposed to the use of recreational hunting to manage mountain lions in South Dakota, because the objective of such killing is merely for trophies and not subsistence. This practice is not only cruel and unnecessary, but researchers have found that excessive hunting of mountain lions leads to increased conflicts with humans, pets and livestock. Hunting of mountain lion also harms ungulates because these top carnivores target sick animals, including those with chronic wasting disease. Finally, a national survey sponsored by the National Shooting Sports Foundation shows that the majority of Midwesterners, including South Dakotans, oppose trophy hunting.

For these reasons, and those outlined in Appendix A of these comments, we request that the Commission reject the Proposal and protect South Dakota’s mountain lions from trophy hunting now and in perpetuity. If GFP is to continue allowing the hunting of mountain lions, we request that the agency limit the practice to sustainable levels to protect South Dakota’s iconic mountain lion population from excessive killing and to limit conflicts caused by indiscriminate hunting of these native cats. Specifically, we request the following changes:

1.) Lift the arbitrary population objective of 200-300 total mountain lions and limit the annual hunting quota to no more than 14% of South Dakota’s adult/subadult mountain lion population. This amounts to no more than 38 mountain lions, based on GFP’s most recent estimate of 277 adult/subadult lions in the state. GFP could also develop an annual quota based on an average population over the last five years, to account for the agency’s widely fluctuating population estimates.

Hunting above 14% of the mountain lion population results in declines to the population. Colorado Parks and Wildlife (CPW) has recently adopted a cap of 14% on mountain lion hunting quotas in certain regions as part of their new West Slope Mountain Lion Management Plan. Additionally, CPW has adopted a cap of 16% on total human-caused mortality to account for other sources of lion deaths. While Colorado’s lions still require
additional protection from trophy hunting, these new caps demonstrate the growing acceptance by state wildlife agencies that heavy hunting on mountain lions, including what is currently allowed in South Dakota, is unsustainable and, indeed, harmful to the state’s mountain lion population.

GFP’s Proposal continues to authorize trophy hunting on mountain lions that exceeds this sustainable level, threatening the stability of South Dakota’s mountain lion population as well as their range expansion to their historic range where they had been extirpated. We call on the agency to implement a 14% cap on hunting mortality and a 16% cap on total human-caused mortality based on adult/subadult population estimates while doing away with the agency’s arbitrary population objective of 200-300 total mountain lions.

2.) Implement a 20% sublimit on female hunting mortality as a proportion of total hunting mortality. Multiple studies across the western U.S. demonstrate that limiting female mortality to approximately 20% of total hunting mortality is necessary to ensure a stable population. Based on the current population estimate and an estimated sustainable quota of 38 total lions, GFP must limit the female subquota to no more than eight cats.

While still higher than what is sustainable, Colorado Parks and Wildlife has implemented a 22% adult female mortality sublimit on total hunting mortality and the Arizona Game and Fish Department has implemented a 25% adult female mortality sublimit on total hunting mortality. GFP must take additional steps to protect resident females and ensure hunting of females does not exceed sustainable levels. The current subquota of 40 female mountain lions out of a total quota of 60 lions is far too high.

3.) Prohibit the hunting of mountain lions with hounds throughout South Dakota, including outside of the Black Hills Fire Protection District. Currently, the Proposal would expand the allowance for hound hunting outside of the Black Hills Fire Protection District that originates on private land to cross over or culminate on private land or public land, as long as it’s not expressly prohibited by the managing entity.

As detailed in Appendix A, using radio-collared hounds to chase mountain lions and bay them into trees or rock ledges so a trophy hunter can shoot at close range is unsporting, unethical and inhumane. Hounds kill kittens, and mountain lions often injure or kill hounds. The practice is exceedingly stressful and energetically taxing to mountain lions. Furthermore, hound hunting is not considered “fair chase” hunting by most. Hounds also chase and stress non-target wildlife, from porcupines to deer, and trespass onto private lands. If GFP is to continue allowing the hunting of mountain lions, the agency must prohibit the use of hounds.

In conclusion, South Dakota’s mountain lions are a vital component of our natural wild heritage and deserve reasoned management for long-term conservation. If GFP is to continue allowing hunting of mountain lions, the agency must limit the practice to no more than 14% of the adult/subadult population so that it does not exceed sustainable levels and implement a female sublimit of 20% of total hunting mortality. Additionally, total human-caused mortality must be limited to no more than 16% of the mountain lion population. Lastly, hound hunting of mountain lions must be prohibited throughout South Dakota, not expanded as GFP has proposed. Thank you for your consideration.

Sincerely,

Darci Willemssen Adams

Appendix A

I. Trophy hunting of mountain lions is unsustainable, cruel and harmful to family groups

Trophy hunting is the greatest source of mortality for mountain lions throughout the majority of their range in the United States. The practice is harmful to more than just the wild cats who are killed. Conservation biologists have derided this practice as unnecessary and wasteful. Batavia et al. (2018) write: Compelling evidence shows that the animals hunted as trophies have sophisticated levels of “intelligence, emotion and sociality” that are “profoundly disrupted” by trophy hunting. For these reasons, GFP must not allow trophy hunting of mountain lions in our state:

1.) Trophy hunting is unsustainable and cruel: Large-bodied carnivores are sparsely populated across vast areas, invest in few offspring, provide extended parental care to their young, have a tendency towards infanticide, females limit reproduction and social stability promotes their resiliency. Human persecution affects their social structure and harms their persistence.

Research shows that trophy hunting results in additive mortality—trophy hunters increase the total mortality to levels that far exceed what would occur in nature. In fact, the effect of human persecution is “super additive,” meaning that hunter kill rates on large carnivores has a multiplier effect on the ultimate increase in total mortality over what would occur in nature due to breeder loss, social disruption and its indirect effects including increased infanticide and decreased recruitment of their young. When trophy hunters remove the stable adult mountain lions from a population, it encourages subadult males to immigrate, leading to greater aggression between cats and mortalities to adult females and subsequent infanticide.

Biologists Wolfe et al. (2015) recommend that states manage mountain lions at a metapopulation level rather than at the single population level. They further add, “We recommend a conservative management approach be adopted to preclude potential over-harvest in future years.” Instead, South Dakota’s mountain lions experience additive levels of mortality. Extensive research shows that this additive mortality caused by high levels of hunting results in population sinks. High hunting mortality does not result in decreased numbers and densities of mountain lions because of compensatory emigration and immigration responses, typically by dispersing subadult males.

2.) Trophy hunting is particularly harmful to kittens and their mothers: In heavily hunted populations, female mountain lions experience higher levels of intraspecific aggression (fights with other cats) resulting in predation on themselves and their kittens. Over-hunting harms a population’s ability to recruit new members if too many adult females are removed. A Utah study shows that trophy hunting adult females orphans their kittens, leaving them to die by dehydration, malnutrition, and/or exposure. Kittens are reliant upon their mothers beyond 12 months of age.

3.) Trophy hunting harms entire mountain lion communities: A recent study on mountain lions shows that they are quite social and live in “communities,” with females sharing kills with other females, their kittens and even with the territorial males. In return for these meals, the adult males protect the females and their kittens from incoming males. Disrupting these communities leads to deadly intraspecific strife, including infanticide and social chaos within the family groups. Trophy hunting destabilizes mountain lion populations, which may cause increased conflicts with humans, pets and livestock.
4.) **Trophy hunting is unnecessary, as mountain lions are a self-regulating**. Mountain lions occur at low densities relative to their primary prey, making them sensitive to bottom-up (prey declines) and top-down (human persecution) influences. Their populations must stay at a much smaller size relative to their prey’s biomass or risk starvation. They do this by regulating their own numbers. When prey populations decline, so do mountain lion populations. Mountain lion populations also require expansive habitat, with individual cats maintaining large home ranges that overlap with one another.

5.) **Killing large numbers of mountain lions halts their ability to create trophic cascades in their ecosystems, which benefits a wide range of flora, fauna and people:** Mountain lions serve important ecological roles, including providing a variety of ecosystem services. As such, conserving these large cats on the landscape creates a socio-ecological benefit that far offsets any societal costs. Their protection and conservation has ripple effects throughout their natural communities. Researchers have found that by modulating deer populations, mountain lions prevented overgrazing near fragile riparian systems, resulting in greater biodiversity. Additionally, carrion left from mountain lion kills feeds scavengers, beetles, foxes, bears and other wildlife species, further enhancing biodiversity.

6.) **Hound hunting is harmful to mountain lions, hounds and non-target wildlife:** Using radio-collared trailing hounds to chase mountain lions and bay them into trees or rock ledges so a trophy hunter can shoot at close range is un sporting, unethical and inhumane. Hounds kill kittens, and mountain lions often injure or kill hounds. The practice is exceedingly stressful and energetically taxing to mountain lions.

To escape from the hounds, mountain lions use evasive maneuvers such as running in figure eights, scrambling up trees or steep hillsides and using quick turns to evade the pursuing pack of barking hounds. As a result, mountain lions could exceed their aerobic budgets causing their muscles to go anaerobic (while hounds are capable of running a steady pace with little ill effect). A study by Bryce et al. (2017) found that for every one minute the hounds chased a mountain lion, it cost the cat approximately five times what would have been expended if the cat had been hunting. In other words, a 3.5-minute chase likely equaled 18 minutes of energy the mountain lion would have expended on hunting activities necessary to find prey.

Hounding is not considered “fair chase” hunting by most. Fair chase hunting is predicated upon giving the animal an equal opportunity to escape from the hunter. The use of hounds provides an unfair advantage to trophy hunters who rely on hounds to do the bulk of the work in finding and baying a mountain lions. Hounds also chase and stress non-target wildlife, from porcupines to deer, and trespass onto private lands.

II. **Hunting mountain lions does not boost prey populations**

Research shows that ungulates are ultimately limited more by their food resources and other habitat factors (“bottom-up” limitations), rather than by natural predation by carnivores (“top down” regulators). However, when herds lose those carnivores, they suffer poorer health and body condition, as well as more degraded habitats. With a healthy assemblage of native carnivores, ecosystems enjoy the benefits from top-down regulation, which increases the health of ungulate herds with which they are integrally coevolved.

The best available science demonstrates that killing native carnivores to increase ungulate populations is unlikely to produce positive results. Numerous recent studies demonstrate that carnivore removal actions “generally had no effect” in the long term on ungulate populations. Because ecological systems are complex, heavily persecuting mountain lions will fail to address the underlying malnutrition problems that deer face. Research also shows that disruption by oil and gas drilling does, in fact, greatly harm mule deer populations.
If South Dakota wants to grow its ungulate populations, then GFP must foster survival of adult female mule deer and elk to stem declines, and it must increase nutritional conditions for ungulates as these factors are the most important for mule deer survival.59

Persecuting mountain lions will not help bighorn sheep recruitment, either. It is clear from the literature that bighorn sheep populations are in decline in the U.S. because of unregulated market hunting, trophy hunting, disease from domestic sheep,60 resource competition by livestock, and loss of habitat.61 Sawyer and Lindsey (2002) surveyed more than 60 peer-reviewed articles concerning predator-prey relationships involving bighorn sheep and mountain lions, concluding that while predator control is often politically expedient, it often does not address underlying environmental issues including habitat loss, loss of migration corridors, and inadequate nutrition.62 The best available science suggests that persecuting mountain lion populations is not a solution for enhancing bighorn sheep numbers. That is because mountain lion predation upon bighorn sheep is a learned behavior conducted by a few individuals who may not repeat their behavior.63 Similar behavior has been documented on endangered mountain caribou in the southern Selkirk Mountains, where trophy hunting disrupted sensitive mountain lion communities, female lions took to higher altitudes to avoid incoming, infanticidal young males, and preyed upon mountain caribou.64

South Dakota can better plan for bighorn sheep management by selecting relocation sites for bighorn sheep that have little stalking cover.65 Escape terrain that contains cliffs, rocks, and foliage makes excellent ambush cover for a mountain lion and should be avoided.66 Also, the amount of mountain lion predation is generally greater on small-sized bighorn sheep populations (those with fewer than 100 individuals) than on other, larger bighorn sheep populations.67 A host of authors reviewed by McKinney et al. (2006) and Ruth and Murphy (2010) recommend only limited mountain lion removals to benefit bighorn sheep populations.68

III. Mountain lions provide significant ecosystem benefits to their prey and other wildlife, as well as economic benefits to South Dakotans

Mountain lions help prevent deadly deer-vehicle strikes69 that can result in numerous human mortalities and pose significant financial and ecological costs to society.70 In fact, by reducing vehicle collisions with deer, mountain lions saved drivers $1.1 million in collision costs annually in South Dakota.71 Additionally, highways fragment wildlife habitats, which can lead to both genetic inbreeding problems and direct mortality from vehicle collisions.72 The cost of vehicle-animal collisions can be mitigated with the construction of highway structures that are designed to draw specific species such as deer across them, preventing not only vehicle strikes, but protecting species and people while saving millions of dollars annually.73

Moreover, mountain lions help maintain the health and viability of ungulate populations by preying on sick individuals, reducing the spread of disease such as chronic wasting disease (CWD) and brucellosis. For example, during a study in Rocky Mountain National Park, researchers found mountain lions preyed on deer infected with CWD.74 The study concluded that adult deer preyed upon by mountain lions were more likely to have CWD than deer shot by hunters. According to the study, “The subtle behaviour changes in prion-infected deer may be better signals of vulnerability than body condition, and these cues may occur well before body condition noticeably declines.”75 This demonstrates that mountain lions select for infected prey and may be more effective at culling animals with CWD, including during the early stages of the disease when they are less infectious, than hunters who rely on more obvious signs of emaciation that occur in later stages of the disease when they are more infectious. Moreover, the mountain lions consumed more than 85% of carcasses, thereby removing a significant amount of the disease from the environment.76
This ecosystem benefit is increasingly important as CWD infection continues to grow in prevalence and distribution in South Dakota and neighboring states. Hammering our state’s mountain lion population through high levels of trophy hunting undermines one of our best defenses against the spread of this deadly disease.

IV. Trophy hunting increases human-mountain lion conflict and livestock depredation

Hunting and lethal control of mountain lions results in increased conflicts because lions’ social structure are destabilized. A review of predator-removal studies found that the practice is “typically an ineffective and costly approach to conflicts between humans and predators” and, as a long-term strategy, will result in failure. Instead, the authors concluded, non-lethal alternatives to lethal removal of native carnivores, coupled with coexistence (husbandry techniques) may resolve conflicts.

A Washington state study shows that as mountain lion complaints increased, wildlife officials lengthened seasons and increased quotas to respond to what they believed was a growing lion population. However, the public’s perception of an increasing population and greater number of livestock depredations was actually the result of a declining female and increasing male population. Heavy hunting of mountain lions skewed the ratio of young males in the population by causing compensatory immigration and emigration, even though it resulted in no net change in the population.

Study authors found that the sport hunting of mountain lions to reduce complaints and livestock depredations had the opposite effect. Killing mountain lions disrupts their social structure and increases both complaints and livestock depredations. Peebles et al. (2013) write:

“Each additional cougar [i.e. mountain lion] on the landscape increased the odds of a complaint of livestock depredation by about 5%. However, contrary to expectations, each additional cougar killed on the landscape increased the odds by about 50%, or an order of magnitude higher. By far, hunting of cougars had the greatest effects, but not as expected. Very heavy hunting (100% removal of resident adults in 1 year) increased the odds of complaints and depredations in year 2 by 150% to 340%.”

Similarly, a study published just this year shows the very same result: lethal removal of mountain lions is associated with increased conflicts, especially on small hoofstock including sheep and goats. Dellinger et al. (2021) state:

“Removals can thus create a negative-feedback loop that leads to increasing conflict and lethal removal, which could begin to negatively impact the mountain lion population via reduced gene flow and population viability (Hiller et al. 2015, Vickers et al. 2015, Benson et al. 2019). Thus, maintaining an older age structure by reducing lethal removal of resident adults could mitigate depredations (Logan 2019).”

Hunting disrupts mountain lions’ sex-age structure and tilts a population to one that is composed of younger males, who are more likely to engage in livestock losses than animals in stable, older populations. In 2019, the Humane Society of the United States published a report on livestock losses from mountain lions using the U.S. Department of Agriculture’s data. For South Dakota’s cattle and sheep ranchers, 2015 data show that most livestock losses came from maladies (illnesses, birthing problems, weather and theft) with far fewer losses coming from native carnivores and domestic dogs together. In 2015, nearly 96 percent of unwanted
cattle losses in South Dakota were from maladies with only 0.17 percent coming from mountain lions, according to the USDA. According to 2014 data, zero sheep were lost to mountain lions in South Dakota.

Rather than allowing trophy hunting of mountain lions, GFP must make a concerted effort to utilize non-lethal methods when rare conflicts occur, prioritizing these above lethal removal of mountain lions. The current reliance on lethal removal for mountain lions that enter a human community is cruel and not in line with best management practices for mountain lion conservation. Techniques such as hazing and relocation are viable options that prevent unnecessary killing and are largely supported by the majority of South Dakotans, as detailed within the Plan. According to surveys of South Dakota residents in 2018, public education, relocation and hazing are by far the most widely supported methods for addressing human, pet and livestock conflicts with mountain lions.

Furthermore, GFP must work with livestock owners to ensure they are adequately and appropriately employing non-lethal deterrence techniques. Installing predator-proof enclosures, using livestock guardian animals, or utilizing frightening devices are all effective strategies to prevent conflicts with mountain lions and other carnivores. Other livestock husbandry practices are also essential at reducing conflicts with carnivores. Livestock operators should:

- Keep livestock, especially maternity pastures, away from areas where wild cats have access to ambush cover.
- Keep livestock, especially the most vulnerable—young animals, mothers during birthing seasons and hobby-farm animals—behind barriers such as electric fencing and/or in barns or pens or kennels with a top. The type of enclosure needs to be specific for the carnivore species to prevent climbing, digging or jumping.
- Move calves from pastures with chronic predation problems and replace them with older, less vulnerable animals.
- Concentrate calving season (i.e., via artificial insemination) to synchronize births with wild ungulate birth periods.
- In large landscapes, use human herders, range riders and/or guard animals. Guard dogs work better when sheep and lambs are contained in a fenced enclosure rather than on open range lands where they can wander unrestrained.
- Some of the low-cost sound and or visual equipment that deter wild cats include suspended clothing, LED flashing lights (sold as “Foxlights”), and radio alarm boxes set off to make alarm sounds/noises near pastures.

According to USDA data from 2015, only an estimated 11.2 percent of cattle and calf operations in South Dakota used any nonlethal predator control methods. Expanding the use of suitable techniques that are landscape and animal specific is essential to reducing conflicts and preventing the death of livestock as well as wild carnivores.

V. Trophy hunting of mountain lions is not economically sound or supported by the majority of Americans who want to see wildlife protected

Trophy hunting of mountain lions is not in the best interest of this iconic species, nor does it represent the interests of the public majority. The practice deprives citizens of their ability to view or photograph wild
mountain lions. Nonconsumptive users are a rapidly growing stakeholder group who provide immense economic contributions to the communities in which they visit. The U.S. Fish and Wildlife Service’s 2016 wildlife-recreation report indicates that wildlife watchers nationwide have increased 20 percent from 2011, numbering 86 million and spending $75.9 billion, while all hunters declined by 16 percent, with the biggest decline in big game hunter numbers, from 11.6 million in 2011 to 9.2 million in 2016. Altogether, hunters spent $25.6 billion in 2016, about one-third that spent by wildlife watchers (Fig. 2).

| Figure 2: Wildlife recreation participation & expenditures, 2011 vs. 2016 data |
|---------------------------------|-----|-----|-----|
|                                 | 2011 | 2016 | Change |
| **Numbers**                     |      |      |        |
| Wildlife watchers               | 71.8M | 86.0M | +14.2M (+20%) |
| All hunters                     | 13.7M | 11.5M | -2.2M (-16%) |
| Big game                        | 11.6M | 9.2M  | -2.4M (-20%) |
| Small game                      | 4.5M  | 3.5M  | -1M (-22%)  |
| Migratory birds                 | 2.6M  | 2.4M  | -0.2M (-8%)  |
| Other animals                   | 2.2M  | 1.3M  | -0.9M (-41%) |
| **Expenditures**                |      |      |        |
| Wildlife watchers               | $59.1B | $75.9B | +$16.8B (+28%) |
| All hunters                     | $36.3B | $25.6B | -$10.7B (-29%) |

The public values mountain lions and views them as an indicator of healthy environments while posing little risk to people living near them. A new study indicates that Americans highly value wildlife, including top carnivores such as mountain lions, and are concerned about their welfare and conservation. Surveys also show that the majority of Americans, including in Midwestern states, do not support trophy hunting, and are particularly opposed to mountain lion hunting. Authorizing a trophy hunting season is not in the best interest of South Dakotans who prefer that mountain lions remain on the landscape, without threat of persecution.

To: Game Fish and Parks Commission  
Re: Proposed Mountain Lion Hunting Season  
August 24th, 2021

Dear Commissioners,

I am writing to oppose the proposed changes to the Mountain Lion Hunting Season.

I recommend a reduction of harvest limits since South Dakota has a small lion population. The current hunt quota of 60 lions is unsustainable for a population still trying to reestablish where it was previously driven to near extinction. These are special species and part of a natural and healthy ecosystem. According to the slide presentation by Andy Lindholm presented at one of your meetings, a more sustainable limit should be to reduce harvests from 60-40 for males and from 40 to 25 female. Total sustainable mortality limits for cougar management needs to monitor the total mortality of cougars, not just from harvest, but also any sort of deaths of cougars from road kills, depredation, or other natural causes. This will give the agency a much clearer picture about how many cougars we have and when hunting need to be limited to make sure we have a robust and sustainable population.

In addition, I strongly oppose the use of hounds for hunting Mountain Lions. The practice of using hounds is not only cruel, but also offers hunters an unfair advantage over lions. Hounds are often equipped with GPS collars which the hunters follow, only to shoot the lion out of a tree. This creates additional unfairness to boot hunters as well. According to your own survey, some hunters commented that “Hounds chase the lions out not give boot hunters a fair chance.”, “Keep season as is, no dogs”. It’s evident that some hunters oppose this practice as well.

I hope over time Game Fish and Parks will begin to realize that the practice to trying to “manage species” is much better off being managed by nature itself.

Thank you,

Caryn Lerman

RE: Petition – Mountain Lion Season Restrictions

Dear Chair Olson and members of the South Dakota Game, Fish and Parks Commission,

We write to you on behalf of our South Dakota members to voice our concerns for the proposed harvest limits for the upcoming 2021/2022 and 2022/2023 seasons.

South Dakota Game, Fish and Parks (SDGFP) has recommended a harvest limit of 60 mountain lions or 40 female mountain lions for the 2021-2022 and the same for the 2022-2023 seasons. This recommendation is aggressive and does not consider basic mountain lion biology for achieving the population objective of a stable population of 200-300 mountain lions in the Black Hills.1 We urge the Commission to put an end to mountain lion hunting in the State, or at minimum, to reduce harvest limits to sustainable levels.

Except in rare instances, mountain lions do not require management to control growth because their populations are self-regulating. This is driven by mountain lion social structure, territoriality, the abundance of prey, and the carrying capacity of the land to support those populations.2 Additionally, human encroachment on wild land leads to habitat loss and reduced connectivity, resulting in a lower carrying capacity for both predator and prey species.3

As outlined in the South Dakota Mountain Lion Management Plan, 2019-2029, SDGFP’s mountain lion management goals are restricted to the Black Hills ecosystem in western South Dakota.1 Based on the

amount of suitable mountain lion habitat in the Black Hills, we estimate the carrying capacity for mountain lions in the Black Hills to be about 230 adult mountain lions. This means that, without hunting and by natural processes, mountain lion biology and social structure, the mountain lion population in the Black Hills ecosystem would remain stable at around 230 adult mountain lions. As this number is within the SDGFP population objective of 200-300 mountain lions in the Black Hills, we urge you, the Commission, to protect South Dakota’s small mountain lion population and put an end to trophy hunting in the State.

Mountain lion hunting results in additive mortality – rates that far exceed what would happen in nature – and can lead to population instability and decline. In order to maintain a stable population of mountain lions, prevent human-wildlife conflict, and avoid compromising the long-term viability of mountain lion populations by failing to account for all human-caused sources of mortality, hunting of adult mountain lions should not exceed the intrinsic growth rate of the population of interest. The intrinsic growth rate for mountain lion populations has been established to be 1.14, or 14%. Additionally, when female mountain lion harvest exceeds 20% of total harvest, this is also likely to lead to population instability, as females contribute disproportionately to the population.

When setting harvest limits for mountain lions, one must account for all sources of anthropogenic mountain lion mortality, not just harvest mortality. Anthropogenic mortality includes hunting, mountain lions killed for public safety, mountain lions killed for preying on domestic livestock, poaching, vehicle collisions, and more.

The South Dakota Mountain Lion Management Plan, 2019-2029 cites a “population objective of 200-300 mountain lions in the Black Hills ecosystem of South Dakota” and the 2019 Mountain Lion Population Status Update reports a population estimate of 203 adult/sub-adult mountain lions in the Black Hills prior to the 2018-2019 season. Since this last published estimate, 120 mountain lions have been killed through hunting, alone (Table 1). These numbers do not account for any other source of human-caused mortality and percentages are based off of the 2018 population estimate of 203 adult/sub-adult mountain lions, therefore, total mortality is likely higher. This is not sustainable.

Table 1. South Dakota mountain lion harvest mortality since last published mountain lion population estimate of 203 adult/subadult mountain lions* in the Black Hills, prior to 2018-2019 season.

<table>
<thead>
<tr>
<th>Season</th>
<th>Mountain Lions Harvested</th>
<th>Percent of Population*</th>
</tr>
</thead>
<tbody>
<tr>
<td>2018-2019</td>
<td>21</td>
<td>10%</td>
</tr>
<tr>
<td>2019-2020</td>
<td>51</td>
<td>25%</td>
</tr>
<tr>
<td>2020-August 2021</td>
<td>48</td>
<td>23%</td>
</tr>
</tbody>
</table>

For perspective, 51 mountain lions were harvested in South Dakota in 2020, and so far this year, 48 mountain lions have been harvested. This could account for more than 25% of the population in the Black Hills and this number does not include other human-caused mortality. Therefore, total anthropogenic mortality is likely higher. Despite this, the proposal before you recommends a harvest limit of 60 mountain lions or 40 female mountain lions for each of the next two years! This is not sustainable and not the way to achieve a stable population objective of 200-300 mountain lions in the Black Hills.

Harvest limits for the upcoming 2021/2022 and 2022/2023 seasons should not exceed 20 total mountain lions or 4 female mountain lions to account for other anthropogenic mortality, to maintain stable a stable population, and so as not to exceed the intrinsic growth rate of 14%.6

South Dakota’s small mountain lion population already faces many threats, including aggressive harvest limits that could account for more than 30% of the State’s adult mountain lion population. If it is the goal of SDGFP to maintain a stable mountain lion population, then South Dakota’s mountain lions must be given more protections, not fewer.

We urge the commission to end mountain lion hunting in South Dakota or, at minimum, to lower the harvest limit to 20 mountain lions or 4 female mountain lions, and not to approve the proposed hunt limit of 60 mountain lions or 40 female mountain lions for the 2021/2022 and 2022/2023 seasons.

South Dakota Game, Fish and Parks Commission
523 East Capitol Avenue
Pierre, SD 57501

Dear Commissioners,

The South Dakota Division of the Izaak Walton League of America thanks you for the opportunity to comment on the proposal pertaining to Aquatic Invasive Species (AIS). The Division is very concerned with the spread of AIS in South Dakota and around the nation. We support all measures that limit and restrict movement of AIS to other waters and areas.

The GFP staff recommends an exemption for launching a boat, dock, or boat lift into waters within the state that is not clean, drained, and dried. This allows equipment to be relaunched in the same water if it was stored on the owner’s property or at a marina on the same water. The proposal’s supporting information also provides an exemption to existing statute allowing lakeshore or riparian property owners to remove AIS plants or mussels in front of their residence without violating the statute. The Division urges the commission to adopt the two exceptions.

However, the Division asks the Department and the Commission to amend this proposal to include language preventing the movement or relocation of boat lifts, docks, or other equipment into another waterbody for a minimum of three weeks. If equipment is sold or transferred to another party that equipment cannot be deployed or relaunched before at least 21 days. This is based on a regulation approved by the Minnesota Department of Natural Resources. *As of July 1, 2012, a boat lift, dock, swim raft, or associated equipment that has been removed from any water body may not be placed in another water body until a minimum of 21 days have passed.* The Division believes this will help to protect South Dakota’s waters and prevent the spread of AIS.

The South Dakota Division of the Izaak Walton League of America strongly encourages your serious consideration and adoption of the suggested language. We appreciate the opportunity to comment on this proposal.

Sincerely,

Kelly Kistner
President IWLA South Dakota Division
